CWM-based Recovery v5.5.0.2

- reboot system now
- install zip from sdcard
- wipe data/factory reset
- wipe cache partition
- backup and restore
- mounts and storage
- advanced

CWM-based Recovery v5.5.0.2

CWM-based Recovery v6.0.2.7

- reboot system now
- install zip from sdcard
- install zip from sideload
- wipe data/factory reset
- wipe cache partition
- backup and restore
- mounts and storage
- advanced

CWM-based Recovery v6.0.2.7

When it comes to custom recoveries, ClockwordMod (CWM) used to be the most widely used system. A custom recovery can perform several different tasks that will help you in your Android developer adventures. So if you're wanting to use CWM as your custom recovery, this guide will help you get everything setup properly. CWM is no longer maintained by the community. If you're looking for a custom recovery, we strongly recommend TWRP instead. Install CWM Recovery There are two different ways to get your recovery installed. For those of you that are comfortable with with using ADB, this method is for you. Before we get into it, you'll need ADB and Fastboot drivers installed. Install ADB and Fastboot drivers To get everything setup properly, you can use this very simple tool created by XDA member Snoop05. Download an install using the guide fro in this XDA thread. 15 Second ADB Installer Enable USB Debugging To enable USB debugging, navigate to Settings > Developer Options > USB Debugging Install VIA ADB Open the folder where your CWM Recovery .img file is saved. Then open a CMD window inside that folder. To do that, Shift + Right click on any empty white space inside the folder and then select Open command window here. Connect your Android device to the PC. Type the following into the command window to boot your device into bootloader/fastboot mode: adb reboot bootloader ¹ If your asks for permission to "Allow USB debugging", tap OK. Once your device boots into bootloader mode, type this into the command line. fastboot flash recovery twrp-2.8.x-x-xxx.img ¹ Here modify CWM.img with the name of your CWM recovery .img file. Once CWM is successfully flashed on your device, type this final command to reboot your device. fastboot reboot Install VIA ROM Manager A simple way of doing all of this is to install the ROM Manager app from the Play store. If your device is rooted, you should be able to flash the custom recovery right from your phone. No need to plug it into the computer or worry about drivers or anything like that. ROM Manager CWM Features Reboot System This one is pretty self explanatory. Reboot back into your system from the recovery Install zip from SD card This is a common feature used by flashaholics. Transfer your ROMs to your SD card from your computer and flash them with ease. Very easy, just like my sister (R.I.P.). Wipe data/factory reset Wipe your phone clean and get a fresh start. If you get stuck in a bootloop or something, this is usually your savior. Wipe cache partition Your cached data will stack up fast these days. Everytime I check my cache I've got about two or three GB being used up. Clear all of that up through your recovery. Backup and restore You can do full system backups to you local storage or your SD card. You can then restore from those backups if anything goes wrong. So CWM is a safe bet if you're looking for a custom recovery. It's one of the originals and it's used by most Android developers. Woot. Requesting that someone make a flashable zip from the newest CWM Touch Image, especially as new 4.4 KitKat ROMs are requiring CWM-based recoveries. I understand that this can be accomplished through ROM Manager (but I'm getting a download error) or through fast-boot/adb (which I admittedly don't have the time, patience or complete understanding to do) so if someone had time to make a flashable zip, I'd imagine that'd benefit the community greatly. There is an older version here (but OP is no longer updating or supporting. Will attach the IMG below. Thank you. Reactions: dosboss57, erikemp and frome90l Thank you Naddict. Has anyone flashed with the CWM zip version? Has anyone successfully gone back to Twrp? Any issues flashign oen tot he other? I haven't flashed a cwm zip, I just use rom manager to install it. But I've gone back and forth a few times recently with no problems. Just messing around the other day I installed a 4.4 and set it up and then flashed twrp and backed up the 4.4. Wiped the phone went back to a 4.3 and then restored the 4.4 nandroid with twrp without any troubles. Apparently it's the initial install that you need cwm for, but caution is advised for now as the next time it may not work. I was bored and just messing around. As always YMMV! Is there a way to flash cwm on the official firmware for this phone using Odin? Sent from my SAMSUNG-SGH-I717 using xda app-developers app Thank you Naddict. Has anyone flashed with the CWM zip version? Has anyone successfully gone back to Twrp? Any issues flashign oen tot he other? I had made my own cwm touch flash zip as others have instructed. You just flash it with twrp if that's what using and use twrp to reboot to recovery to see the newly flashed cwm touch recovery. Vice versa for installing twrp again. However; just remember, backups can only be restored from recovery they were made with. Sent from my SAMSUNG-SGH-I717 using Tapatalk Can I flash this while in a previous cwm recovery ? Sent from my SAMSUNG-SGH-I717 using xda app-developers app Can I flash this while in a previous cwm recovery ? Sent from my SAMSUNG-SGH-I717 using xda app-developers app Sure. I assume you have your previous version zip in case you want to flash back? I just have latest cwm touch and twrp 2.6.1.0. and twrp 2.5 that I keep on hand. Sent from my SAMSUNG-SGH-I717 using Tapatalk Thanks! Since my usb is all screwed up (i rotate batteries on external charger) i can't use odin to do my CWM flash. This is exactly what i need. Thanks!! Need kernel source code used for that recovery HI guys. I was wondering if someone could post the kernel source code that was used for that clockword mod recovery. I need to create a insertable kernel module in recovery mode for the samsung galaxy note. Regards cwm recovery zip Can this cwm recovery zip be used for any phone? And can it be flashed to a phone using rash? Micromax My phone is Micromax a190. The model no. Is not yet uploaded on XDA and I don't have any recoveries available for my phone nor do I have any custom Roms available. What do I do now? Page 2 cwm recovery zip Thanks a lot bro! Can I flash this using the stock recovery on my Moto G boost variant??? samsung After i installed the screen shows only samsung logo after that its not booting.. Please help. My device samsung galaxy s advance GT-I9070..when i plug in usb also its not showing. now can i copy and install new one. Please can u guys make a flashable zip for note 3 n900 i want to switch to cwm from twrp The latest version of ClockworkMod recovery - a custom recovery used for flashing custom ROMs - is v6.0 which brings improvements such as up to 4-5x faster backup and restores as well as smaller incremental backups. Now, the touch version of ClockworkMod (CWM) recovery 6.0 is available for the Galaxy Tab 2 10.1 tablets, thanks to XDA Forum Member yepitsme19. While non-touch CWM recovery is available for the Tab 2 10.1, the touch version provides much better navigation and ease of use thanks to the touch-enabled interface, and the guide below will walk you through the steps for flashing ClockworkMod Touch recovery on your Galaxy Tab 2 10.1 (all three variants). So, continue reading for the installation steps. Compatibility This firmware and the guide below are compatible only and only with Galaxy Tab 2 10.1, model numbers P5100/P5110/P5113. It's not compatible with other devices. Check your device's model number in: Settings » About tablet. Warning! The methods and procedures discussed here are considered risky and you should not attempt anything if you don't not know completely what it is. If any damage occurs to your device, we won't be held liable. How to Install ClockworkMod Recovery on Galaxy Tab 2 10.1 P5110/P5113/P5100 It's important you've the proper drivers for the phone installed. If you have installed Samsung's Kies software, you already have the drivers, so download them only if you haven't installed Kies. Download links: 32 bit (x86) Windows | 64-bit (x64) Windows Download Odin (used to flash recovery on phone). Download Odin | Filename: Odin3-v1.85 3.zip Extract the Odin3-v1.85 3.zip file downloaded in step 2 to a convenient location on the computer. Download the CWM Touch recovery file according to your device's model number (check in Settings » About), from the development page. The downloaded file will have the .tar extension. Do not extract this file even if it shows up as a compressed file. Important! In further steps, whenever it says Volume Down button, it means the button next to the POWER button. Whereas Volume Up is the button on the far side of the POWER button i.e. on the right side of the Volume Down button. In short, Volume Down is the left button while the Volume Up button is the right button. Disconnect the tablet from PC (if connected) then turn if off. Then, boot it in download mode by pushing and holding down the Power and Volume UP buttons at the same time. When a yellow triangle shows up on-screen, press Volume Down to enter download mode. Open Odin — double-click the Odin3 v1.85.exe that you got after extracting the file Odin3-v1.85 3.zip in step 3. Connect your tablet to PC now. You should get the message "Added!" under Odin's message box in the bottom left. If you don't get this message, then probably there is a problem with drivers. Make sure you've proper drivers installed. Now, in ODIN, click the PDA button, and select the file .tar file that you downloaded in step 4. Do not make any other changes in Odin except selecting the required file in PDA. Leave all other options as they are. Now, hit the START button to start flashing the recovery. When the flashing is complete, your tablet will automatically reboot — and when you see the Samsung logo, you can safely unplug the cable. Plus, you'll get a PASS (with green background) message in the left-most box at the very top of Odin. What to do if Odin gets stuck: If ODIN gets stuck and doesn't seem to be doing anything, or you get a FAIL message (with red background) in ODIN, do the following - disconnect the tablet from the PC, close ODIN, remove battery, re-insert it, turn tablet on in Download mode, and do the procedure again from Step 7. ClockworkMod Touch recovery can then be used by booting into recovery by turning off the tablet, then holding down the Power and Volume Down buttons at the same time till the screen turns on, then letting go of the power button but continuing to hold down Volume Down button for a few more seconds till CWM recovery shows up. ClockworkMod Touch Recovery is now installed on your Galaxy Tab 2 10.1, which you can use to install custom ROMs with a easy to use touch interface.
