Hyponatremia signs and symptoms

Hyponatremia signs and symptoms edema. Hyponatraemia signs and symptoms nhs. Hyponatremia signs and symptoms ati. Hyponatremia signs and symptoms deep tendon reflexes. Hyponatremia signs and symptoms mnemonic. Hyponatremia signs and symptoms nursing. Hyponatremia signs and symptoms quizlet. Hyponatremia signs and symptoms in dogs.

Hyponatremia, defined as a concentration of sodium serum less than 135 MEQ / L, is a common and important electrolytic imbalance that can be seen in isolation or, as more often is the case, as a complication of other medical diseases (For example, heart failure, hepatic insufficiency, kidney failure, pneumonia). [1, 2] The normal concentration of sodium serum is 135-145 MEQ / L. Common European guidelines classify hyponatremia in adults according to the concentration of sodium serum, as follows [3]: MILD: 130-134 mmol / l Moderator: 125-129 mmol / l deep: 48 hours, the treatment must be calibrated to avoid osmotic demolent syndrome (ODS), which can derive from excessively rapid correction. The symptoms range from nausea and malaise, with slight reduction of sodium serum, to lethargy, decrease in level of consciousness, headache, and (if serious) convulsions and coma. More neurological symptoms are often due to very low sodium serious levels (usually
